

SEO Implementation & Results Report

Project: Skintillatingg Luxury Aesthetic Clinic **Domain:** `www.skintillatingg.co.in` **Date:** September 2026

1. Executive Summary

The primary objective of this project was to resolve indexing issues with the newly connected custom domain (`www.skintillatingg.co.in`), ensure the website was discoverable on Google Search, and establish a robust Technical SEO foundation for a multi-page Next.js web application.

2. Technical SEO Audit & Strategy

During the initial audit, several issues were identified that prevented Google from correctly indexing the site:

- Duplicate Content Issue:** Google discovered both the Vercel staging domain (`skintillatingg.vercel.app`) and the custom domain, resulting in a "Duplicate without user-selected canonical" indexing block.
- Missing Canonical Tags:** The site lacked explicit instructions telling Google which URL was the primary/official version.
- Dynamic Page Metadata:** Dynamic routes (like individual treatment pages) lacked specific SEO titles and descriptions.
- Search Appearance:** The favicon did not meet Google's strict sizing requirements for search result branding.

3. Implementation Details

A. Resolution of the Indexing Block (Canonical Tags)

We injected precise `<link rel="canonical">` tags into every static and dynamic page layout. This resolved the Google Search Console error by explicitly instructing Googlebot to ignore the Vercel staging URL and prioritize the `skintillatingg.co.in` custom domain.

B. Dynamic Metadata Generation

We implemented Next.js `generateMetadata` on the dynamic treatment pages (`/treatments/[slug]`). This ensures that when Google crawls a specific treatment (e.g., "Booster Shots" or "HIFU"), it reads a highly targeted page title, description, and OpenGraph image, rather than a generic fallback.

C. Rich Results & Medical JSON-LD Schema

To ensure the clinic qualifies for enhanced "Rich Snippets" (like map packs and detailed business cards in search), we integrated a robust `MedicalClinic` and `LocalBusiness` JSON-LD schema into the root layout. This structured data explicitly defines the clinic's:

- Founder (Dr. Akshaya Jain)
- Exact location and contact details
- Opening hours
- Core medical specialties and available procedures

D. Google Search Branding (Favicon)

We replaced the unsupported `.svg` favicon with a perfectly padded, `512x512` transparent `.png` square icon. This adheres to Google's strict guidelines, ensuring the brand logo displays professionally next to search results.

E. Future-Proofing for AI Agents (`ai.txt`)

We authored and deployed an `ai.txt` file at the root of the domain. This acts as a direct instruction manual for emerging AI search engines (like ChatGPT Search, Perplexity, and Google AI Overviews), explicitly providing them with the clinic's core context, specialties, and permission to index the data.

4. Results & Verification

1. Google Rich Results Validation:

- **Status:** PASSED.
- The Google Rich Results testing tool verified our JSON-LD implementation, confirming 0 errors and successfully detecting both "Local Business" and "Organization" entities.

2. Google Search Console Live Test:

- **Status:** PASSED.
- Live testing confirmed the domain is completely accessible, returning a perfect 200 OK HTTP response, with Googlebot correctly reading the new canonical tags.

3. Active Indexing (Page 1 Appearance):

- **Status:** SUCCESS.
 - Within 24 hours of requesting indexing, the custom domain began appearing on the first page of Google Search results for the brand keyword "Skintillatingg".
-

5. Next Steps for Continued Growth

With the technical foundation perfectly established, future SEO efforts should transition to **Off-Page SEO**:

1. **Google Business Profile:** Ensure the "Website" link on the Google Maps listing points to `https://www.skintillatingg.co.in`.
2. **Backlink Generation:** Update all social media profiles (Instagram, LinkedIn) and medical directories (Practo, Justdial) to link directly to the new custom domain.
3. **Patience:** Allow Google's algorithm 1-3 weeks to fully process the site, index all internal pages (like the homepage), and update the image caches for the new favicon.
